
Pocket Workflow Guide

Before You Begin

Every recipe here is a **starting point**. Coffee is a natural product — origin, roast age, humidity, and time of day all affect extraction. Use these parameters as your baseline, but always **taste critically** and dial in before service.

The C+ Standard

Taste before serving. If you would not drink it yourself, do not serve it. Precision without tasting is just ritual — tasting without precision is just guessing. At C+, we do both.

Grind Size — Always Check the In-Store Recipe

Each EG-1 has a unique calibration — the same number on two machines can produce very different results. Always refer to the recipe card at your station for the correct grind setting. When in doubt, dial in by taste.

1. Espresso Workflow

All espresso drinks at C+ are built on a double shot pulling 36 g. If the shot is not dialled in, nothing else matters.

Recipe

Parameter	Value
Dose	18 g (±0.1 g)
Beverage Weight	36 g (ratio 1:2)
Shot Time	25–35 s
Tolerance	±1 g weight, ±2 s time

Adjust ratio per coffee: lighter roasts may suit 1:2.5, darker roasts 1:1.5–1:2.

The 10 Steps

1. **Spray (RDT) —** Weigh 18.0 g beans on the Subscale (±0.1 g). One spray of RDT to control static.
2. **Grind —** Transfer to EG-1. Grind into dosing cup. Zero retention = zero waste.
3. **Shake —** Transfer to Blind Shaker. 3–4 shakes to break clumps and homogenise distribution.
4. **Navigator —** Pour into portafilter. PUQ Prep Navigator for automatic WDT distribution.
5. **Distribute —** Normcore Gravity Distributor to level the bed flat and uniform.
6. **Tamp —** Weber Really Nice Tamper — firm, even, straight down. No twist, no polish.
7. **Air Blow —** Remove loose grounds from rim and basket edges to protect group head seal.
8. **Scale Setup —** Acaia Lunar under cup. Tare to zero.
9. **Extract —** Insert portafilter, start extraction. Monitor time + weight. Target 36 g in 25–35 s.
10. **Flush & Clean —** Flush group head with water. Clean portafilter inside and out.

The Golden Rule

Never serve a channelled shot. Uneven, watery, or squirting flow from a naked portafilter means the shot is compromised. Discard and remake.

Milk Steaming

Phase 1 — Aeration: Position the steam wand tip 'kissing' the surface. **Do not incorporate air while the milk is cold:** begin aerating only above 37°C to avoid solid fat crystals destroying foam structure.

Drink	Stretching
Flat White	~2 seconds
Latte / Seasonal / Swiss Mocca	~3 seconds
Cappuccino	~4 seconds

Phase 2 — Texturing: Submerge wand deeper, heat without adding air. Target: **55–65°C**. Extra-hot (customer request): 65–70°C max. Never re-steam milk.

Milk Waste

Estimate the milk you need before steaming. A cortado needs far less than a latte. You should finish each pour with little to no milk left in the jug.

2. V60 Workflow

2 Pax Recipe (Asaad's Recipe)

Parameter	Value
Coffee	15 g
Water	240 ml (1:16)
Bloom Temp	88°C
Pour Temp	92°C
Grind	Medium-fine (check in-store recipe)
Brew Time	2:20–2:40

Step-by-Step

1. **Prepare —** V60 or Kinto OCT on server. Rinse filter with hot water (Fellow Stagg EKG Pro). Discard rinse. Place on MHW-3BOMBER scale, tare.
2. **Dose —** Weigh 15.0 g (±0.1 g). Grind into brewer. Level bed with a gentle shake.
3. **Bloom (0:00–0:45) —** Pour 45 g at 88°C in gentle spiral. Swirl once. Wait 45 s. The lower temp preserves delicate aromatics.
4. **First Pour (0:45–1:15) —** Pour to 120 g at 92°C. Slow spiral, low turbulence. Targets sweetness and clarity.
5. **Second Pour (1:15–1:45) —** Pour to 200 g. Slightly increased flow. Builds body.
6. **Final Pour (1:45–2:00) —** Pour to 240 g. Centre pour only — no spiral. Clean finish.
7. **Drawdown —** Drain completely. Target: 2:20–2:40. Flat bed = proper technique.
8. **Serve —** Swirl server to homogenise. **Taste before serving.** Serve immediately.

4 Pax Recipe

Parameter	Value
Coffee	40 g
Water	480 ml (1:12)
Bloom / Pour Temp	88°C / 92°C
Grind	Medium (coarser than 2 pax)

Same staged pour technique adapted for larger dose. The ratio shifts to 1:12 — deeper bed means longer contact time, so lower ratio + coarser grind maintain balance. **Always taste and adjust.**

3. Chemex Workflow

The Chemex's thick bonded filter slows drawdown and removes more oils, producing a remarkably clean, bright cup. A single high temperature (97°C) maintains adequate extraction throughout.

Recipe

Parameter	Value
Dose	30 g
Water	510 g (~1:17)
Grind	Medium-coarse (check in-store recipe)
Water Temp	97°C throughout
Brew Time	3:30–4:00

Step-by-Step

1. **Prepare —** Unfold filter: three-layer side faces spout. Rinse thoroughly, discard through spout. Scale, tare.
2. **Dose —** 30.0 g (±0.1 g). Grind medium-coarse (coarser than V60, like coarse sand). Level bed.

3. **Bloom (0:00–0:35) —** Pour 45–60 g at 97°C. At 0:10, gently stir slurry to ensure full saturation. Wait until 0:35.
4. **Main Pour (0:35–1:10) —** Pour steadily in slow spirals to 510 g. All water in ~35 s. Avoid filter walls.
5. **Stir & Spin —** At ~1:10, one slow stir at outer edge. Then gentle swirl (Rao Spin) to level the bed.
6. **Drawdown —** Drain completely. Target: 3:30–4:00. If exceeding 4:00, grind coarser.
7. **Serve —** Remove filter. Swirl to homogenise. **Taste before serving.** Serve immediately.

4. BIRD Workflow

The BIRD combines full immersion with piston-driven vacuum filtration. No-bypass brewing means every gram of water contributes to extraction — rich, full-bodied cup with pour-over clarity.

Recipe

Parameter	Value
Dose	25 g
Water	350 g (~1:14)
Water Temp	92–94°C
Grind	Medium (check in-store recipe)
Brew Time	3:00–4:00 (incl. vacuum pull)
Expected Yield	~300–330 ml

Step-by-Step

1. **Pod Prep —** Mesh screen into Pod, Abaca paper filter on top. Insert Pod into glass chamber, push to bottom.
2. **Preheat —** Fill with hot water, wait 15–20 s, pour out. Place on MHW-3BOMBER scale, tare.
3. **Dose & Grind —** 25.0 g (±0.1 g). Grind into chamber. Grounds rest on Pod/filter.

4. **Add Water (0:00) —** Pour 350 g at 92–94°C evenly over grounds. Ensure full saturation.
5. **Agitate (0:15) —** Insert Claw. 3–5 gentle up-and-down plunges. Gentle turbulence, not violent.
6. **Steep (0:30–2:30) —** Undisturbed for ~2 minutes. Full immersion = maximum contact.
7. **Vacuum Pull (2:30–3:30) —** Turn Wingnut to draw Pod upward slowly. 45–60 s pull ideal. Too fast = less clarity; too slow = over-extraction.
8. **Serve —** Pour into cup or server. **Taste before serving.** Expect ~300–330 ml.
9. **Cleanup —** Snap Drip Catcher onto Pod. Let puck cool, compost grounds. Rinse all parts with warm soapy water. No dishwasher.

Vacuum Speed

Slow pull (45–60 s) = cleaner, more nuanced cup. Fast pull (~15–30 s) = bolder, more full-bodied. Experiment to match each coffee.

Always Taste

No two harvests or roast batches behave identically. These recipes give you a framework — the final calibration comes from your palate. Taste every coffee you prepare, especially the first of the day and when opening a new bag. If it's not right, adjust: grind, dose, temperature, or time.

Dial in at the start of every shift. Espresso parameters drift — check and adjust as needed. Keep your station clean. If you run out of something or notice equipment issues, speak up immediately.

Your palate is a muscle. The more you taste — attentively, critically, consistently — the sharper it becomes.
